**Std 12 Practical Geograp** 

# Ketabton.com

#### (e) ketabton.com: The Digital Library Hundamental sets of GIS

### Data - Management - Science - Decision

### GIS -- What is it? No easy answer anymore!

- Geographic/Geospatial Information
  - information about places on the earth's surface
  - knowledge about "what is <u>where</u> when" (Don't forget time!)
  - Geographic/geospatial: synonymous
  - GIS -- what's in the S?
    - Systems: the technology
    - Science : the concepts and theory
    - Studies : the societal context

(c) ketapton.com: The Digital Library GIS: a formal definition

"A system for capturing, storing, checking, integrating, manipulating, analysing and displaying data which are spatially referenced to the Earth. This is normally considered to involve a spatially referenced computer database and appropriate applications software"

#### **GIS definition - layman**

"... a special case of information system where the database consists of observations on spatially distributed features, activities or events, which are definable in space as points, lines or area. A geographic information systems manipulates data about these points, lines and areas to retrieve data for ad hoc queries and analyses" wetabtom.com: The Digital Library GIS unique?

GIS handles SPATIAL information

- Information referenced by its location in space
- GIS makes connections between activities based on spatial proximity

### GIS concepts are not new!

London cholera epidemic 1854

### Soho

Water pump

(c) retabion.com: The Digital Library GIS: historical background

GIS: Today

Abstracting the Real World

(c) ketabton.com: The Digital Library We Live in Two Worlds

#### **Natural World**

#### **Constructed World**

#### **Self-Regulating**

#### Managed

... These Are Increasingly In Conflict

(c) Hetabton.com: The Digital Library and Content

#### Seeing the Whole

- Patterns
- Linkages
- Trends

- Watersheds
- Communities
- Neighborhoods
- Districts

#### International organizations

to uses GIS?

- UN, The World Bank, UNEP, WHO, etc.
- Private industry
  - Transport, Real Estate, Insurance, etc.
- Government

c) ketabton.com: The Digital Library

- Ministries of Environment, Housing, Agriculture, etc.
- Local Authorities, Cities, Municipalities, etc.
- Provincial Agencies for Planning, Parks, Transportation, etc.
- Non-profit organizations/NGO's
  - World Resources Institute, WWF, etc.
- Academic and Research Institutions
  - IITs
  - MITs
  - NASA
  - SAC
  - NRSA etc

# do with a GIS?

- 80% of **local government** activities estimated to be geographically based
  - Wards, zoning, public works (streets, water supply, sewers), garbage collection, land ownership and valuation, public safety (fire and police)
- a significant portion of **state government** has a geographical component
  - natural resource management
  - highways and transportation
  - businesses use GIS for a very wide array of applications
    - retail site selection & customer analysis
    - logistics: vehicle tracking & routing
    - natural resource exploration (petroleum, etc.)
    - precision agriculture
    - civil engineering and construction

#### • Military and defense (War analysis)

- Battlefield management
- Satellite imagery interpretation
- scientific research employs GIS
  - geography, geology, botany
  - anthropology, sociology, economics, political science
  - Epidemiology, criminology

- EIA
- Land use planning
- Disasters Management
- Crime control
- SDSS

#### (c) ketabton.com: The Digital Library Examples of Applied GIS

#### Urban Planning, Management & Policy

- Zoning, subdivision planning
- Land acquisition
- Economic development
- Code enforcement
- Housing renovation programs
- Emergency response
- Crime analysis
- Tax assessment

#### • Environmental Sciences

- Monitoring environmental risk
- Modeling storm water runoff
- Management of watersheds, floodplains, wetlands, forests, aquifers
- Environmental Impact Analysis
- Hazardous or toxic facility siting
- Groundwater modeling and contamination tracking

#### Political Science

- Redistricting
- Analysis of election results
- Predictive modeling

- Civil Engineering/Utility
  - Locating underground facilities
  - Designing alignment for freeways, transit
  - Coordination of infrastructure maintenance
- Business
  - Demographic Analysis
  - Market Penetration/ Share Analysis
  - Site Selection
- Education Administration
  - Attendance Area Maintenance
  - Enrollment Projections
  - School Bus Routing
- Real Estate
  - Neighborhood land prices
  - Traffic Impact Analysis
  - Determination of Highest and Best Use
- Health Care
  - Epidemiology
  - Needs Analysis
  - Service Inventory

### Cross-disciplinary nature of GIS

Geographic Information Technologies

### Global Positioning Systems (GPS)

- a system of earth-orbiting satellites which can provide precise (100 meter to sub-cm.) location on the earth's surface (in lat/long coordinates or equiv.)
- Remote Sensing (RS)
  - use of satellites or aircraft to capture information about the earth's surface
  - Digital ortho images a key product (map accurate digital photos)
- Geographic Information Systems (GISy)
  - Software systems with capability for input, storage, manipulation/analysis and output/display of geographic (spatial) information

GPS and RS are sources of input data for a GISy. A GISy provides for storing and manipulating GPS and RS data.

#### (c) ketabton.com: The Digital Library What GIS Applications Do:

### manage, analyze, communicate

- make possible the **automation** of activities involving geographic data
  - map production
  - calculation of areas, distances, route lengths
  - measurement of slope, aspect, viewshed
  - logistics: route planning, vehicle tracking, traffic management
- allow for the <u>integration</u> of data hitherto confined to independent domains (e.g property maps and air photos).
- by tieing data to maps, permits the succinct **communication of complex spatial patterns** (e.g environmental sensitivity).
- provides answers to spatial queries (how many elderly in Richardson live further than 10 minutes at rush hour from ambulance service?)
- perform complex **spatial modelling** (*what if* scenarios for transportation planning, disaster planning, resource management, utility design)

### Raster data

![](_page_25_Picture_4.jpeg)

(c) Retable from: The Digital Library pulation and analysis

What would happen if . . . A chemical leaked into a tube wells?
Where does . . . The Green Belt exist in relation to the City?
Has . . .

Population changed over the last ten years?
Is there a spatial pattern related to . . .
Car ownership in our area?

Databases & GIS

- At a simple level a GIS may just form the graphical interface to a database
- The majority of GIS applications follow this example

![](_page_27_Figure_4.jpeg)

Linked database table

SQL Query Manager

#### (c) ketabton.com: The Digital Library The GIS Data Model: Purpose

 allows the geographic features in real world locations to be digitally represented and stored in a database so that they can be abstractly presented in map (analog) form, and can also be worked with and manipulated to address some problem

![](_page_28_Figure_2.jpeg)

#### (c) ketapton.com: The Digital Library The GIS Data Model: Implementation

Geographic Integration of Information

![](_page_29_Figure_2.jpeg)

- Data is organized by layers, coverages or themes (synonomous concepts), with each layer representing a common feature.
- Layers are integrated using explicit location on the earth's surface, *thus geographic location is the organizing principal*.

### The GIS Model: example

![](_page_30_Picture_2.jpeg)

longitude

![](_page_30_Picture_4.jpeg)

![](_page_30_Picture_5.jpeg)

longitude

Here we have three <u>layers</u> or themes: *--roads*,

--hydrology (water),

*--topography (land elevation)* They can be related because precise geographic coordinates are recorded for each theme.

Layers are comprised of two data types •*Spatial data* which describes location (where) •*Attribute data* specifing what, how much, when

Layers may be represented in two ways:
in *vector* format as points and lines
in *raster(or image)* format as pixels

All geographic data has 4 properties: *projection, scale, accuracy and resolution* 

(of Keitabton. com: The Digital Library Spatial and Attribute Data

- Spatial data (where)
  - specifies location
  - stored in a *shape file, geodatabase* or similar <u>geographic</u> file
- Attribute (descriptive) data (what, how much, when)
  - specifies characteristics at that location, natural or humancreated
  - stored in a data base <u>table</u>

GIS systems traditionally maintain spatial and attribute data separately, then "join" them for display or analysis

• for example, in ArcView, the *Attributes of* ... table is used to link a *shapefile* (spatial structure) with a *data base table* containing attribute information in order to display the attribute data spatially on a map

"Projection, cont The Digital Library on, Scale, Accuracy and Resolution

the key properties of spatial data

- **Projection:** the method by which the curved 3-D surface of the earth is represented by X,Y coordinates on a 2-D flat map/screen
  - distortion is inevitable
- Scale: the ratio of distance on a map to the equivalent distance on the ground
  - in theory GIS is scale independent but in practice there is an implicit range of scales for data output in any project
- Accuracy: how well does the database info match the real world
  - *Positional*: how close are features to their real world location?
  - Consistency: do feature characteristics in database match those in real world
    - is a road in the database a road in the real world?
  - *Completeness*: are all real world instances of features present in the database?
    - Are all roads included.
- **Resolution:** the size of the smallest feature able to be recognized
  - for raster data, it is the *pixel* size

The tighter the specification, the higher the cost.

# Examples
