517. Minor

The minor M_{ij} associated with the element a_{ij} of n -th order matrix A is the $(n-1)$ -th order determinant derived from the matrix A by deletion of its i -th row and j -th column.

518. Cofactor

$$C_{ij} = (-1)^{i+j} M_{ij}$$

519. Laplace Expansion of n-th Order Determinant

Laplace expansion by elements of the i-th row

$$\det A = \sum_{j=1}^n a_{ij} C_{ij}, \quad i = 1, 2, \dots, n.$$

Laplace expansion by elements of the j-th column

$$\det A = \sum_{i=1}^n a_{ij} C_{ij}, \quad j = 1, 2, \dots, n.$$

5.2 Properties of Determinants

520. The value of a determinant remains unchanged if rows are changed to columns and columns to rows.

$$\begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix} = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$$

521. If two rows (or two columns) are interchanged, the sign of the determinant is changed.

$$\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} = - \begin{vmatrix} a_2 & b_2 \\ a_1 & b_1 \end{vmatrix}$$

522. If two rows (or two columns) are identical, the value of the determinant is zero.

$$\begin{vmatrix} a_1 & a_1 \\ a_2 & a_2 \end{vmatrix} = 0$$

CHAPTER 5. MATRICES AND DETERMINANTS

- 523.** If the elements of any row (or column) are multiplied by a common factor, the determinant is multiplied by that factor.

$$\begin{vmatrix} ka_1 & kb_1 \\ a_2 & b_2 \end{vmatrix} = k \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$$

- 524.** If the elements of any row (or column) are increased (or decreased) by equal multiples of the corresponding elements of any other row (or column), the value of the determinant is unchanged.

$$\begin{vmatrix} a_1 + kb_1 & b_1 \\ a_2 + kb_2 & b_2 \end{vmatrix} = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}$$

5.3 Matrices

- 525.** Definition

An $m \times n$ matrix A is a rectangular array of elements (numbers or functions) with m rows and n columns.

$$A = [a_{ij}] = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix}$$

- 526.** **Square matrix** is a matrix of order $n \times n$.
- 527.** A square matrix $[a_{ij}]$ is **symmetric** if $a_{ij} = a_{ji}$, i.e. it is symmetric about the leading diagonal.
- 528.** A square matrix $[a_{ij}]$ is **skew-symmetric** if $a_{ij} = -a_{ji}$.

CHAPTER 5. MATRICES AND DETERMINANTS

- 529.** **Diagonal matrix** is a square matrix with all elements zero except those on the leading diagonal.
- 530.** **Unit matrix** is a diagonal matrix in which the elements on the leading diagonal are all unity. The unit matrix is denoted by I.
- 531.** A **null matrix** is one whose elements are all zero.

5.4 Operations with Matrices

- 532.** Two matrices A and B are equal if, and only if, they are both of the same shape $m \times n$ and corresponding elements are equal.
- 533.** Two matrices A and B can be added (or subtracted) of, and only if, they have the same shape $m \times n$. If

$$A = [a_{ij}] = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix},$$
$$B = [b_{ij}] = \begin{bmatrix} b_{11} & b_{12} & \cdots & b_{1n} \\ b_{21} & b_{22} & \cdots & b_{2n} \\ \vdots & \vdots & & \vdots \\ b_{m1} & b_{m2} & \cdots & b_{mn} \end{bmatrix},$$

CHAPTER 5. MATRICES AND DETERMINANTS

then

$$A + B = \begin{bmatrix} a_{11} + b_{11} & a_{12} + b_{12} & \dots & a_{1n} + b_{1n} \\ a_{21} + b_{21} & a_{22} + b_{22} & \dots & a_{2n} + b_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} + b_{m1} & a_{m2} + b_{m2} & \dots & a_{mn} + b_{mn} \end{bmatrix}.$$

534. If k is a scalar, and $A = [a_{ij}]$ is a matrix, then

$$kA = [ka_{ij}] = \begin{bmatrix} ka_{11} & ka_{12} & \dots & ka_{1n} \\ ka_{21} & ka_{22} & \dots & ka_{2n} \\ \vdots & \vdots & & \vdots \\ ka_{m1} & ka_{m2} & \dots & ka_{mn} \end{bmatrix}.$$

535. Multiplication of Two Matrices

Two matrices can be multiplied together only when the number of columns in the first is equal to the number of rows in the second.

If

$$A = [a_{ij}] = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix},$$

$$B = [b_{ij}] = \begin{bmatrix} b_{11} & b_{12} & \dots & b_{1k} \\ b_{21} & b_{22} & \dots & b_{2k} \\ \vdots & \vdots & & \vdots \\ b_{n1} & b_{n2} & \dots & b_{nk} \end{bmatrix},$$

CHAPTER 5. MATRICES AND DETERMINANTS

then

$$AB = C = \begin{bmatrix} c_{11} & c_{12} & \cdots & c_{1k} \\ c_{21} & c_{22} & \cdots & c_{2k} \\ \vdots & \vdots & & \vdots \\ b_{m1} & c_{m2} & \cdots & c_{mk} \end{bmatrix},$$

where

$$c_{ij} = a_{i1}b_{1j} + a_{i2}b_{2j} + \cdots + a_{in}b_{nj} = \sum_{\lambda=1}^n a_{i\lambda}b_{\lambda j}$$

($i = 1, 2, \dots, m; j = 1, 2, \dots, k$).

Thus if

$$A = [a_{ij}] = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \end{bmatrix}, \quad B = [b_i] = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix},$$

then

$$AB = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \end{bmatrix} \cdot \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} = \begin{bmatrix} a_{11}b_1 & a_{12}b_2 & a_{13}b_3 \\ a_{21}b_1 & a_{22}b_2 & a_{23}b_3 \end{bmatrix}.$$

536. Transpose of a Matrix

If the rows and columns of a matrix are interchanged, then the new matrix is called the **transpose** of the original matrix.

If A is the original matrix, its transpose is denoted A^T or \tilde{A} .

537. The matrix A is **orthogonal** if $AA^T = I$.

538. If the matrix product AB is defined, then

$$(AB)^T = B^T A^T.$$

CHAPTER 5. MATRICES AND DETERMINANTS

539. Adjoint of Matrix

If A is a square $n \times n$ matrix, its **adjoint**, denoted by $\text{adj } A$, is the transpose of the matrix of cofactors C_{ij} of A :

$$\text{adj } A = [C_{ij}]^T.$$

540. Trace of a Matrix

If A is a square $n \times n$ matrix, its **trace**, denoted by $\text{tr } A$, is defined to be the sum of the terms on the leading diagonal:

$$\text{tr } A = a_{11} + a_{22} + \dots + a_{nn}.$$

541. Inverse of a Matrix

If A is a square $n \times n$ matrix with a nonsingular determinant $\det A$, then its **inverse** A^{-1} is given by

$$A^{-1} = \frac{\text{adj } A}{\det A}.$$

542. If the matrix product AB is defined, then

$$(AB)^{-1} = B^{-1}A^{-1}.$$

543. If A is a square $n \times n$ matrix, the **eigenvectors** X satisfy the equation

$$AX = \lambda X,$$

while the **eigenvalues** λ satisfy the characteristic equation

$$|A - \lambda I| = 0.$$

where

$$D = \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} = a_1b_2 - a_2b_1,$$

$$D_x = \begin{vmatrix} d_1 & b_1 \\ d_2 & b_2 \end{vmatrix} = d_1b_2 - d_2b_1,$$

$$D_y = \begin{vmatrix} a_1 & d_1 \\ a_2 & d_2 \end{vmatrix} = a_1d_2 - a_2d_1.$$

545. If $D \neq 0$, then the system has a single solution:

$$x = \frac{D_x}{D}, y = \frac{D_y}{D}.$$

If $D = 0$ and $D_x \neq 0$ (or $D_y \neq 0$), then the system has no solution.

If $D = D_x = D_y = 0$, then the system has infinitely many solutions.

$$546. \begin{cases} a_1x + b_1y + c_1z = d_1 \\ a_2x + b_2y + c_2z = d_2, \\ a_3x + b_3y + c_3z = d_3 \end{cases}$$

827. Normal Line

$$y - y_0 = -\frac{1}{f'(x_0)}(x - x_0) \text{ (Fig 176)}$$

828. Increasing and Decreasing Functions.

If $f'(x_0) > 0$, then $f(x)$ is increasing at x_0 . (Fig 177, $x < x_1$, $x_2 < x$),

If $f'(x_0) < 0$, then $f(x)$ is decreasing at x_0 . (Fig 177, $x_1 < x < x_2$),

If $f'(x_0)$ does not exist or is zero, then the test fails.

CHAPTER 8. DIFFERENTIAL CALCULUS

829. Local extrema

A function $f(x)$ has a **local maximum** at x_1 if and only if there exists some interval containing x_1 such that $f(x_1) \geq f(x)$ for all x in the interval (Fig.177).

A function $f(x)$ has a **local minimum** at x_2 if and only if there exists some interval containing x_2 such that $f(x_2) \leq f(x)$ for all x in the interval (Fig.177).

830. Critical Points

A critical point on $f(x)$ occurs at x_0 if and only if either $f'(x_0)$ is zero or the derivative doesn't exist.

831. First Derivative Test for Local Extrema.

If $f(x)$ is increasing ($f'(x) > 0$) for all x in some interval $(a, x_1]$ and $f(x)$ is decreasing ($f'(x) < 0$) for all x in some interval $[x_1, b)$, then $f(x)$ has a local maximum at x_1 (Fig.177).

 $f(x)$ is concave upward at x_0 if and only if $f'(x)$ is increasing at x_0 (Fig.177, $x_3 < x$).
 $f(x)$ is concave downward at x_0 if and only if $f'(x)$ is decreasing at x_0 . (Fig.177, $x < x_3$).
- 835.** Second Derivative Test for Concavity.
 If $f''(x_0) > 0$, then $f(x)$ is concave upward at x_0 .

1078. Definition of Double Integral

The double integral over a rectangle $[a, b] \times [c, d]$ is defined to be

$$\iint_{[a, b] \times [c, d]} f(x, y) dA = \lim_{\substack{\max \Delta x_i \rightarrow 0 \\ \max \Delta y_j \rightarrow 0}} \sum_{i=1}^m \sum_{j=1}^n f(u_i, v_j) \Delta x_i \Delta y_j,$$

where (u_i, v_j) is some point in the rectangle

$(x_{i-1}, x_i) \times (y_{j-1}, y_j)$, and $\Delta x_i = x_i - x_{i-1}$, $\Delta y_j = y_j - y_{j-1}$.

 $0 \leq s \leq S$, and a **scalar function** F is defined over the curve C .

Then

$$\int_0^S F(\vec{r}(s)) ds = \int_C F(x, y, z) ds = \int_C F ds,$$

where ds is the arc length differential.

$$\mathbf{1118.} \quad \int_{C_1 \cup C_2} F ds = \int_{C_1} F ds + \int_{C_2} F ds$$

where the curve C is defined by the polar function $r(\theta)$.

1122. Line Integral of Vector Field

Let a curve C be defined by the vector function $\vec{r} = \vec{r}(s)$, $0 \leq s \leq S$. Then

$$\frac{d\vec{r}}{ds} = \vec{\tau} = (\cos \alpha, \cos \beta, \cos \gamma)$$

is the unit vector of the tangent line to this curve.

Figure 204.

Let a **vector field** $\vec{F}(P, Q, R)$ is defined over the curve C . Then the line integral of the vector field \vec{F} along the curve C is

$$\int_C P dx + Q dy + R dz = \int_0^S (P \cos \alpha + Q \cos \beta + R \cos \gamma) ds.$$

CHAPTER 9. INTEGRAL CALCULUS

1123. Properties of Line Integrals of Vector Fields

$$\int_{-C} (\vec{F} \cdot d\vec{r}) = - \int_C (\vec{F} \cdot d\vec{r}),$$

where $-C$ denote the curve with the opposite orientation.

$$\int_C (\vec{F} \cdot d\vec{r}) = \int_{C_1 \cup C_2} (\vec{F} \cdot d\vec{r}) = \int_{C_1} (\vec{F} \cdot d\vec{r}) + \int_{C_2} (\vec{F} \cdot d\vec{r}),$$

where C is the union of the curves C_1 and C_2 .

1124. If the curve C is parameterized by $\vec{r}(t) = \langle x(t), y(t), z(t) \rangle$,

$\alpha \leq t \leq \beta$, then

$$\begin{aligned} \int_C Pdx + Qdy + Rdz &= \\ &= \int_{\alpha}^{\beta} \left(P(x(t), y(t), z(t)) \frac{dx}{dt} + Q(x(t), y(t), z(t)) \frac{dy}{dt} + R(x(t), y(t), z(t)) \frac{dz}{dt} \right) dt \end{aligned}$$

1125. If C lies in the xy -plane and given by the equation $y = f(x)$,

then

$$\int_C Pdx + Qdy = \int_a^b \left(P(x, f(x)) + Q(x, f(x)) \frac{df}{dx} \right) dx.$$

1126. Green's Theorem

$$\iint_R \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy = \oint_C Pdx + Qdy,$$

where $\vec{F} = P(x, y)\vec{i} + Q(x, y)\vec{j}$ is a continuous vector function with continuous first partial derivatives $\frac{\partial P}{\partial y}$, $\frac{\partial Q}{\partial x}$ in a

some domain R , which is bounded by a closed, piecewise smooth curve C .

CHAPTER 9. INTEGRAL CALCULUS

1127. Area of a Region R Bounded by the Curve C

$$S = \iint_R dx dy = \frac{1}{2} \oint_C x dy - y dx$$

1128. Path Independence of Line Integrals

The line integral of a vector function $\vec{F} = P\vec{i} + Q\vec{j} + R\vec{k}$ is said to be **path independent**, if and only if P, Q, and R are continuous in a domain D, and if there exists some scalar function $u = u(x, y, z)$ (a **scalar potential**) in D such that

$$\vec{F} = \text{grad } u, \text{ or } \frac{\partial u}{\partial x} = P, \frac{\partial u}{\partial y} = Q, \frac{\partial u}{\partial z} = R.$$

Then

$$\int_C \vec{F}(\vec{r}) \cdot d\vec{r} = \int_C P dx + Q dy + R dz = u(B) - u(A).$$

1129. Test for a Conservative Field

A vector field of the form $\vec{F} = \text{grad } u$ is called a **conservative field**. The line integral of a vector function $\vec{F} = P\vec{i} + Q\vec{j} + R\vec{k}$ is path independent if and only if

$$\text{curl } \vec{F} = \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ P & Q & R \end{vmatrix} = \vec{0}.$$

If the line integral is taken in xy-plane so that

$$\int_C P dx + Q dy = u(B) - u(A),$$

then the test for determining if a vector field is conservative can be written in the form

$$\frac{\partial P}{\partial y} = \frac{\partial Q}{\partial x}.$$

CHAPTER 9. INTEGRAL CALCULUS

1130. Length of a Curve

$$L = \int_C ds = \int_{\alpha}^{\beta} \left| \frac{d\vec{r}}{dt}(t) \right| dt = \int_{\alpha}^{\beta} \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2} dt,$$

where C is a piecewise smooth curve described by the position vector $\vec{r}(t)$, $\alpha \leq t \leq \beta$.

If the curve C is two-dimensional, then

$$L = \int_C ds = \int_{\alpha}^{\beta} \left| \frac{d\vec{r}}{dt}(t) \right| dt = \int_{\alpha}^{\beta} \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt.$$

If the curve C is the graph of a function $y = f(x)$ in the xy -plane ($a \leq x \leq b$), then

$$L = \int_a^b \sqrt{1 + \left(\frac{dy}{dx}\right)^2} dx.$$

1131. Length of a Curve in Polar Coordinates

$$L = \int_{\alpha}^{\beta} \sqrt{\left(\frac{dr}{d\theta}\right)^2 + r^2} d\theta,$$

where the curve C is given by the equation $r = r(\theta)$, $\alpha \leq \theta \leq \beta$ in polar coordinates.

1132. Mass of a Wire

$$m = \int_C \rho(x, y, z) ds,$$

where $\rho(x, y, z)$ is the mass per unit length of the wire.

If C is a curve parametrized by the vector function $\vec{r}(t) = \langle x(t), y(t), z(t) \rangle$, then the mass can be computed by the formula

CHAPTER 9. INTEGRAL CALCULUS

$$m = \int_{\alpha}^{\beta} \rho(x(t), y(t), z(t)) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2} dt.$$

If C is a curve in xy -plane, then the mass of the wire is given by

$$m = \int_C \rho(x, y) ds,$$

or

$$m = \int_{\alpha}^{\beta} \rho(x(t), y(t)) \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} dt \text{ (in parametric form).}$$

$$M_{xz} = \int_C y\rho(x, y, z) ds,$$

$$M_{xy} = \int_C z\rho(x, y, z) ds.$$

1134. Moments of Inertia

The moments of inertia about the x -axis, y -axis, and z -axis are given by the formulas

$$I_x = \int_C (y^2 + z^2) \rho(x, y, z) ds,$$

$$I_y = \int_C (x^2 + z^2) \rho(x, y, z) ds,$$

$$I_z = \int_C (x^2 + y^2) \rho(x, y, z) ds.$$

CHAPTER 9. INTEGRAL CALCULUS

1135. Area of a Region Bounded by a Closed Curve

$$S = \oint_C x dy = -\oint_C y dx = \frac{1}{2} \oint_C x dy - y dx.$$

**Figure 205.**

If the closed curve C is given in parametric form $\vec{r}(t) = \langle x(t), y(t) \rangle$, then the area can be calculated by the formula

$$S = \int_{\alpha}^{\beta} x(t) \frac{dy}{dt} dt = -\int_{\alpha}^{\beta} y(t) \frac{dx}{dt} dt = \frac{1}{2} \int_{\alpha}^{\beta} \left(x(t) \frac{dy}{dt} - y(t) \frac{dx}{dt} \right) dt.$$

1136. Volume of a Solid Formed by Rotating a Closed Curve about the x -axis

1137. Work

Work done by a force \vec{F} on an object moving along a curve C is given by the line integral

$$W = \int_C \vec{F} \cdot d\vec{r},$$

where \vec{F} is the vector force field acting on the object, $d\vec{r}$ is the unit tangent vector.

Figure 207.

CHAPTER 9. INTEGRAL CALCULUS

If the object is moved along a curve C in the xy -plane, then

$$W = \int_C \vec{F} \cdot d\vec{r} = \int_C P dx + Q dy,$$

If a path C is specified by a parameter t (t often means time), the formula for calculating work becomes

$$W = \int_{\alpha}^{\beta} \left[P(x(t), y(t), z(t)) \frac{dx}{dt} + Q(x(t), y(t), z(t)) \frac{dy}{dt} + R(x(t), y(t), z(t)) \frac{dz}{dt} \right] dt,$$

where t goes from α to β .

If a vector field \vec{F} is conservative and $u(x, y, z)$ is a scalar potential of the field, then the work on an object moving from A to B can be found by the formula

$$W = u(B) - u(A).$$

1138. Ampere's Law

$$\oint_C \vec{B} \cdot d\vec{r} = \mu_0 I.$$

The line integral of a magnetic field \vec{B} around a closed path C is equal to the total current I flowing through the area bounded by the path.

10.1 First Order Ordinary Differential Equations

1164. Linear Equations

$$\frac{dy}{dx} + p(x)y = q(x).$$

The general solution is

$$y = \frac{\int u(x)q(x)dx + C}{u(x)},$$

where

$$u(x) = \exp\left(\int p(x)dx\right).$$

1165. Separable Equations

$$\frac{dy}{dx} = f(x, y) = g(x)h(y)$$

The general solution is given by

$$\int \frac{dy}{h(y)} = \int g(x)dx + C,$$

or

$$H(y) = G(x) + C.$$

CHAPTER 10. DIFFERENTIAL EQUATIONS

1166. Homogeneous Equations

The differential equation $\frac{dy}{dx} = f(x, y)$ is homogeneous, if the function $f(x, y)$ is homogeneous, that is $f(tx, ty) = f(x, y)$.

The substitution $z = \frac{y}{x}$ (then $y = zx$) leads to the separable equation

$$x \frac{dz}{dx} + z = f(1, z).$$

1167. Bernoulli Equation

$$\frac{dy}{dx} + p(x)y = q(x)y^n.$$

The substitution $z = y^{1-n}$ leads to the linear equation

$$\frac{dz}{dx} + (1-n)p(x)z = (1-n)q(x).$$

1168. Riccati Equation

$$\frac{dy}{dx} = p(x) + q(x)y + r(x)y^2$$

If a particular solution y_1 is known, then the general solution can be obtained with the help of substitution

$z = \frac{1}{y - y_1}$, which leads to the first order linear equation

$$\frac{dz}{dx} = -[q(x) + 2y_1 r(x)]z - r(x).$$

CHAPTER 10. DIFFERENTIAL EQUATIONS

1169. Exact and Nonexact Equations

The equation

$$M(x, y)dx + N(x, y)dy = 0$$

is called **exact** if

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x},$$

and **nonexact** otherwise.

The general solution is

$$\int M(x, y)dx + \int N(x, y)dy = C.$$

1170. Radioactive Decay

$$\frac{dy}{dt} = -ky,$$

where $y(t)$ is the amount of radioactive element at time t , k is the rate of decay.

The solution is

$$y(t) = y_0 e^{-kt}, \text{ where } y_0 = y(0) \text{ is the initial amount.}$$

1171. Newton's Law of Cooling

$$\frac{dT}{dt} = -k(T - S),$$

where $T(t)$ is the temperature of an object at time t , S is the temperature of the surrounding environment, k is a positive constant.

The solution is

$$T(t) = S + (T_0 - S)e^{-kt},$$

where $T_0 = T(0)$ is the initial temperature of the object at time $t = 0$.

CHAPTER 10. DIFFERENTIAL EQUATIONS

1172. Population Dynamics (Logistic Model)

$$\frac{dP}{dt} = kP \left(1 - \frac{P}{M} \right),$$

where $P(t)$ is population at time t , k is a positive constant, M is a limiting size for the population.

The solution of the differential equation is

$$P(t) = \frac{MP_0}{P_0 + (M - P_0)e^{-kt}}, \text{ where } P_0 = P(0) \text{ is the initial population at time } t = 0.$$

10.2 Second Order Ordinary Differential Equations

1173. Homogeneous Linear Equations with Constant Coefficients

$$y'' + py' + qy = 0.$$

The characteristic equation is

$$\lambda^2 + p\lambda + q = 0.$$

If λ_1 and λ_2 are distinct real roots of the characteristic equation, then the general solution is

$$y = C_1 e^{\lambda_1 x} + C_2 e^{\lambda_2 x}, \text{ where}$$

C_1 and C_2 are integration constants.

If $\lambda_1 = \lambda_2 = -\frac{p}{2}$, then the general solution is

$$y = (C_1 + C_2 x) e^{-\frac{p}{2}x}.$$

If λ_1 and λ_2 are complex numbers:

CHAPTER 10. DIFFERENTIAL EQUATIONS

$\lambda_1 = \alpha + \beta i$, $\lambda_2 = \alpha - \beta i$, where

$$\alpha = -\frac{p}{2}, \beta = \frac{\sqrt{4q - p^2}}{2},$$

then the general solution is

$$y = e^{\alpha x} (C_1 \cos \beta x + C_2 \sin \beta x).$$

1174. Inhomogeneous Linear Equations with Constant Coefficients

$$y'' + py' + qy = f(x).$$

The general solution is given by

$$y = y_p + y_h, \text{ where}$$

y_p is a particular solution of the inhomogeneous equation and y_h is the general solution of the associated homogeneous equation (see the previous topic 1173).

If the right side has the form

$$f(x) = e^{\alpha x} (P_1(x) \cos \beta x + P_2(x) \sin \beta x),$$

then the particular solution y_p is given by

$$y_p = x^k e^{\alpha x} (R_1(x) \cos \beta x + R_2(x) \sin \beta x),$$

where the polynomials $R_1(x)$ and $R_2(x)$ have to be found by using the **method of undetermined coefficients**.

- If $\alpha + \beta i$ is not a root of the characteristic equation, then the power $k = 0$,
- If $\alpha + \beta i$ is a simple root, then $k = 1$,
- If $\alpha + \beta i$ is a double root, then $k = 2$.

1175. Differential Equations with y Missing

$$y'' = f(x, y').$$

Set $u = y'$. Then the new equation satisfied by v is

$$u' = f(x, u),$$

which is a first order differential equation.

CHAPTER 10. DIFFERENTIAL EQUATIONS

1176. Differential Equations with x Missing

$$y'' = f(y, y').$$

Set $u = y'$. Since

$$y'' = \frac{du}{dx} = \frac{du}{dy} \frac{dy}{dx} = u \frac{du}{dy},$$

we have

$$u \frac{du}{dy} = f(y, u),$$

which is a first order differential equation.

The motion of a Mass on a Spring is described by the equation

$$m\ddot{y} + ky = 0,$$

where

m is the mass of the object,

The general solution is

$$y = A \cos(\omega_0 t - \delta),$$

where

A is the amplitude of the displacement,

ω_0 is the fundamental frequency, the period is $T = \frac{2\pi}{\omega_0}$,

δ is phase angle of the displacement.

This is an example of simple harmonic motion.

1178. Free Damped Vibrations

$$m\ddot{y} + \gamma\dot{y} + ky = 0, \text{ where}$$

γ is the damping coefficient.

There are 3 cases for the general solution:

CHAPTER 10. DIFFERENTIAL EQUATIONS

Case 1. $\gamma^2 > 4km$ (overdamped)

$$y(t) = Ae^{\lambda_1 t} + Be^{\lambda_2 t},$$

where

$$\lambda_1 = \frac{-\gamma - \sqrt{\gamma^2 - 4km}}{2m}, \quad \lambda_2 = \frac{-\gamma + \sqrt{\gamma^2 - 4km}}{2m}.$$

Case 2. $\gamma^2 = 4km$ (critically damped)

$$y(t) = (A + Bt)e^{\lambda t},$$

where

$$\lambda = -\frac{\gamma}{2m}.$$

Case 3. $\gamma^2 < 4km$ (underdamped)

$$y(t) = e^{-\frac{\gamma}{2m}t} A \cos(\omega t - \delta), \text{ where}$$

$$\omega = \sqrt{4km - \gamma^2}.$$

1179. Simple Pendulum

$$\frac{d^2\theta}{dt^2} + \frac{g}{L}\theta = 0,$$

where θ is the angular displacement, L is the pendulum length, g is the acceleration of gravity.

The general solution for small angles θ is

$$\theta(t) = \theta_{\max} \sin \sqrt{\frac{g}{L}}t, \text{ the period is } T = 2\pi \sqrt{\frac{L}{g}}.$$

1180. RLC Circuit

$$L \frac{d^2I}{dt^2} + R \frac{dI}{dt} + \frac{1}{C}I = V'(t) = \omega E_0 \cos(\omega t),$$

CHAPTER 10. DIFFERENTIAL EQUATIONS

where I is the current in an RLC circuit with an ac voltage source $V(t) = E_0 \sin(\omega t)$.

The general solution is

$$I(t) = C_1 e^{r_1 t} + C_2 e^{r_2 t} + A \sin(\omega t - \varphi),$$

where

$$r_{1,2} = \frac{-R \pm \sqrt{R^2 - \frac{4L}{C}}}{2L},$$

$$A = \frac{\omega E_0}{\sqrt{\left(L\omega^2 - \frac{1}{C}\right)^2 + R^2 \omega^2}},$$

$$\varphi = \arctan\left(\frac{L\omega}{R} - \frac{1}{RC\omega}\right),$$

C_1, C_2 are constants depending on initial conditions.
